# Types

# Types of CS Controls

Tere  
Papa  
Detective  
C  
D  
Chaman

# Technical/Logical Controls

- Encryption
- Antivirus and anti-malware software
- Firewalls
- Security information and event management (SIEM)
- Intrusion Detection Systems (IDS) and Intrusion Prevention Systems (IPS)

# Technical Control Implementation Methods

- Access Control Lists (ACL)
- Configuration Rules
- Administrative controls like policies

# Preventive Controls

- Hardening: It's a process of reducing attacks and tightening security controls.
- Security awareness training: is the process of providing formal cyber security education to employees and stakeholders about security threats and the organization's policies and procedures.
- Change management: Measures taken by an organization to describe and implement changes both internally and externally in the system that include preparing and supporting employees to take the necessary steps for change.
- Account disable policy: This policy will disable the account when an employee leaves the organization.

# Detective Controls

- Log monitoring – analyzing real-time data.
- SIEM- A set of tools and services are offered to analyze various system operational logs.
- Trend Analysis – Identifying the pattern from an application's log output, to gather relevant information.
- Security Audits- set of measures that focus on cyber security standards and guidelines.
- Video Surveillance - Digital images and videos that are sent over communication networks are monitored.
- Motion Detection – Sensors are attached to detect nearby motions.

# Corrective Controls

- IPS: detection of anomalies in traffic flow to quickly prevent malicious activity.
- Backups and system recovery: the Process of creating and storing data copies that can be used as backups when data is lost.

# Other Controls

- **Management controls:** This control is used to mainly focus on risk management and information security management.
- **Operational controls:** The security controls that are primarily implemented, like technical and managerial controls executed by people, are saved by operational controls.
- **Physical controls:** Physical security controls in cyber security are implemented based on cyber measures in a defined structure. That is used to detect or prevent unauthorized access to sensitive data.
- **Deterrent controls:** Deterrent controls are used to reduce deliberate attacks, which are usually in the form of a tangible object or person.
- **Compensating controls:** Compensating control is an alternative method that is used to satisfy the requirement for security.
